Vibe Coding

LLM, and generative AI coding tools

Kwon, Bokyung

AI coding tools

An agent calls the model through an API key and returns tokens that the editor inserts into the file.

Prompting

A prompt gives the model context, examples and the task, and the agent plans before it edits the file.

Agents

An agent loops over tools until the task is done, and the editor shows every edit for review.

Context window

The model reads only the tokens inside its context window, so the agent summarizes long files before coding.

Evaluation

Tests and review catch errors that the model makes, and the API key stays outside the repository.
